Cel szkolenia:

As a developer, your duty is to write bulletproof code. However...

What if we told you that despite all of your efforts, the code you have been writing your entire career is full of weaknesses you never knew existed? What if, as you are reading this, hackers were trying to break into your code? How likely would they be to succeed?

This advanced course will change the way you look at code. A hands-on training during which we will teach you all of the attackers’ tricks and how to mitigate them, leaving you with no other feeling than the desire to know more.

It is your choice to be ahead of the pack, and be seen as a game changer in the fight against cybercrime.

Participants attending this course will:

- Understand basic concepts of security, IT security and secure coding
- Realize the severe consequences of unsecure buffer handling
- Understand the architectural protection techniques and their weaknesses
- Learn about typical coding mistakes and how to avoid them
- Be informed about recent vulnerabilities in various platforms, frameworks and libraries
- Understand the requirements of secure communication
Have a practical understanding of cryptography
Learn about XML security
Understand essential security protocols
Understand some recent attacks against cryptosystems
Understand security considerations in the SDLC
Understand security testing approaches and methodologies
Get practical knowledge in using security testing techniques and tools
Learn how to set up and operate the deployment environment securely
Get sources and further readings on secure coding practices

Audience:
C and C++ developers, software architects and testers

Plan szkolenia:

- IT security and secure coding
  - Nature of security
  - What is risk?
  - IT security vs. secure coding
  - From vulnerabilities to botnets and cybercrime
    - Nature of security flaws
    - Reasons of difficulty
    - From an infected computer to targeted attacks
  - Classification of security flaws
    - Landwehr’s taxonomy
    - The Seven Pernicious Kingdoms
- x86 machine code, memory layout and stack operations
  - Intel 80x86 Processors - main registers
  - Intel 80x86 Processors - most important instructions
  - Intel 80x86 Processors - flags
  - Intel 80x86 Processors - control instructions
  - Intel 80x86 Processors - stack handling and flow control
  - The memory address layout
  - The function calling mechanism in C/C++ on x86
  - Calling conventions
  - The local variables and the stack frame
○ Function calls – prologue and epilogue of a function
○ Stack frame of nested calls
○ Stack frame of recursive functions

○ Buffer overflow
  ○ Stack overflow
    ○ Buffer overflow on the stack
    ○ Overwriting the return address
    ○ Exercises - introduction
    ○ Exercise BOFIntro
    ○ Exercise BOFSHeelcode

○ Protection against stack overflow
  ○ Specific protection methods
  ○ Protection methods at different layers
  ○ The protection matrix of software security
  ○ Stack overflow – Prevention (during development)
  ○ Stack overflow – Detection (during execution)
  ○ Fortify compiler option (FORTIFY_SOURCE)
  ○ Exercise BOFSHeelcode – Using the Fortify compiler option

○ Buffer overflow
  ○ Stack smashing protection
    ○ Stack smashing protection variants
    ○ Stack smashing protection in GCC
    ○ Exercise BOFSHeelcode – Stack smashing protection
    ○ Effects of stack smashing protection
    ○ Bypassing stack smashing protection – an example
    ○ Overwriting arguments – Mitigation

○ Address Space Layout Randomization (ASLR)
  ○ Randomization with ASLR
  ○ Using ASLR
    ○ Practical weaknesses and limitations to ASLR
    ○ Circumventing ASLR: NOP sledding

○ Non executable memory areas – the NX bit
  ○ Access control on memory segments
  ○ The Never eXecute (NX) bit
  ○ Exercise BOFSHeelcode – Enforcing NX memory segments

○ Return-to-libc attack – Circumventing the NX bit protection
- Circumventing memory execution protection
- Return-to-libc attack

- Return oriented programming (ROP)
  - Exploiting with ROP
  - ROP gadgets
  - ROP mitigation
    - Mitigation techniques of ROP attack

- Heap overflow
  - Memory allocation managed by a doubly-linked list
  - Buffer overflow on the heap
  - Steps of freeing and joining memory blocks
  - Freeing allocated memory blocks
  - Case study – Heartbleed
    - TLS Heartbeat Extension
    - Heartbleed – information leakage in OpenSSL
    - Heartbleed – fix in v1.0.1g
  - Protection against heap overflow

- Common coding errors and vulnerabilities
  - Input validation
    - Input validation concepts
  - Integer problems
    - Representation of negative integers
    - Integer ranges
    - Integer overflow
    - Integer problems in C/C++
    - The integer promotion rule in C/C++
    - Arithmetic overflow – spot the bug!
    - Exercise IntOverflow
    - What is the value of abs(INT_MIN)?
    - Signedness bug – spot the bug!
    - Integer truncation – spot the bug!
    - Integer problem – best practices
    - Case study – Android Stagefright

- Injection
  - Injection principles
  - SQL Injection exercise
Typical SQL Injection attack methods
- Blind and time-based SQL injection
- SQL Injection protection methods
- Command injection
- Command injection exercise – starting Netcat

- Printf format string bug
  - Printf format strings
  - Printf format string bug – exploitation
  - Exercise Printf
  - Printf format string exploit – overwriting the return address

- Printf format string problem – best practices
- Some other input validation problems
  - Array indexing – spot the bug!
  - Off-by-one and other null termination errors
  - The Unicode bug

- Path traversal vulnerability
  - Path traversal – weak protections
  - Path traversal – best practices

- Log forging
  - Some other typical problems with log files

- Time and state problems
  - Time and state related problems
  - Serialization errors
  - Exercise TOCTTOU
  - Best practices against TOCTTOU

- Requirements of secure communication
  - Security levels
  - Secure acknowledgment
    - Malicious message absorption
      - Feasibility of secure acknowledgment
      - The solution: Clearing Centers
  - Inadvertent message loss

- Integrity
  - Error detection - Inadvertent message distortion (noise)
    - Modeling message distortion
    - Error detection and correction codes
- Authenticity - Malicious message manipulation
  - Modeling message manipulation
  - Practical integrity protection (detection)
- Non-repudiation
  - Non-repudiation
- Summary
  - Detecting integrity violation
- Confidentiality
  - Model of encrypted communication
  - Encryption methods in practice
  - Strength of encryption algorithms
- Remote identification
  - Requirements of remote identification
- Anonymity and traffic analysis
  - Model of anonymous communication
  - Traffic analysis
  - Theoretically strong protection against traffic analysis
  - Practical protection against traffic analysis
- Summary
  - Relationship between the requirements
- Practical cryptography
  - Rule #1 of implementing cryptography
  - Cryptosystems
    - Elements of a cryptosystem
  - Symmetric-key cryptography
    - Providing confidentiality with symmetric cryptography
    - Symmetric encryption algorithms
    - Modes of operation
    - Symmetric encryption with OpenSSL: encryption
    - Symmetric encryption with OpenSSL: decryption
  - Other cryptographic algorithms
    - Hash or message digest
    - Hash algorithms
    - SHAterred
    - Hashing with OpenSSL
    - Message Authentication Code (MAC)
- Providing integrity and authenticity with a symmetric key
- Random number generation
  - Random numbers and cryptography
  - Cryptographically-strong PRNGs
  - Weak PRNGs in C and C++
  - Stronger PRNGs in C
  - Generating random numbers with OpenSSL
  - Hardware-based TRNGs
- Asymmetric (public-key) cryptography
  - Providing confidentiality with public-key encryption
  - Rule of thumb – possession of private key
  - The RSA algorithm
    - Introduction to RSA algorithm
    - Encrypting with RSA
    - Combining symmetric and asymmetric algorithms
    - Digital signing with RSA
    - Asymmetric encryption with OpenSSL
    - Digital signatures with OpenSSL
- Public Key Infrastructure (PKI)
  - Man-in-the-Middle (MitM) attack
  - Digital certificates against MitM attack
  - Certificate Authorities in Public Key Infrastructure
  - X.509 digital certificate
- XML security
  - XML injection
    - Exercise – XML injection
    - Protection through sanitization and XML validation
    - XML parsing in C++
  - Abusing XML Entity
    - XML Entity introduction
    - Exercise – XML bomb
    - XML bomb
    - XML external entity attack (XXE) – resource inclusion
    - Exercise – XXE attack
    - Preventing entity-related attacks
    - Case study – XXE in Google Toolbar
Security protocols
- Secure network protocols
- Specific vs. general solutions
- IPSEC protocol family
  - IPSEC standards
  - Security Association (SA)
  - Message formats
  - AH packet structure
  - ESP packet structure
  - Protected channels
  - More complex set-ups
  - Traffic control
  - SA structure
  - Key management
- The TLS protocol
  - SSL and TLS
  - Usage options
  - Security services of TLS
  - SSL/TLS handshake
- Protocol-level vulnerabilities
  - BEAST
  - FREAK
  - FREAK – attack against SSL/TLS
  - Logjam attack
- Padding oracle attacks
  - Adaptive chosen-ciphertext attacks
  - Padding oracle attack
  - CBC decryption
  - Padding oracle example
  - Lucky Thirteen
  - POODLE
- Common coding errors and vulnerabilities
  - Improper use of security features
    - Typical problems related to the use of security features
    - Password management
      - Exercise – Weakness of hashed passwords
      - Password management and storage
Special purpose hash algorithms for password storage
Argon2 and PBKDF2 implementations in C/C++
bcrypt and scrypt implementations in C/C++
Case study – the Ashley Madison data breach
Typical mistakes in password management
Exercise – Hard coded passwords

Sensitive information in memory
Protecting secrets in memory
Sensitive info in memory - minimize the attack surface
Your secrets vs. dynamic memory
Zeroisation
Zeroisation vs. optimization – Spot the bug!
Copies of sensitive data on disk
Core dumps
Disabling core dumps
Swapping
Memory locking - preventing swapping
Problems with page locking
Best practices

Improper error and exception handling
Typical problems with error and exception handling
Empty catch block
Overly broad catch
Exercise ErrorHandling – spot the bug!
Exercise - Error handling
Case study - "e;#iamroot"e; authentication bypass in macOS
Authentication process in macOS (High Sierra)
Incorrect error handling in opendirectoryd
The #iamroot vulnerability (CVE-2017-13872)

Code quality problems
Dangers arising from poor code quality
Poor code quality – spot the bug!
Unreleased resources
Type mismatch – Spot the bug!
Exercise TypeMismatch
Memory allocation problems
- Smart pointers
- Zero length allocation
- Double free
- Mixing delete and delete[]

- Use after free
  - Use after free – Instance of a class
  - Spot the bug
  - Use after free – Dangling pointers

- Case study - WannaCry
  - The WannaCry ransomware
  - The vulnerability behind WannaCry – spot the bug!
  - Lessons learned

- Security in the software development lifecycle
  - Building Security In Maturity Model (BSIMM)
  - Software Assurance Maturity Model (SAMM)
  - Microsoft Security Development Lifecycle (SDL)

- Security testing
  - Functional testing vs. security testing
  - Security vulnerabilities
  - Prioritization – risk analysis
  - Security assessments in various SDLC phases
  - Security testing methodology
    - Steps of test planning (risk analysis)
    - Scoping and information gathering
      - Stakeholders
      - Assets
      - Security objectives for testing

- Threat modeling
  - Attacker profiles
  - Threat modeling
  - Threat modeling based on attack trees
  - Threat modeling based on misuse/abuse cases
  - Misuse/abuse cases – a simple example
  - SDL threat modeling
  - The STRIDE threat categories
  - Diagramming – elements of a DFD
- Data flow diagram - example
- Threat enumeration - mapping STRIDE to DFD elements
- Risk analysis - classification of threats
- The DREAD risk assessment model

- Testing steps
  - Deriving test cases
  - Accomplishing the tests
  - Processing test results
  - Mitigation concepts
  - Standard mitigation techniques of MS SDL
  - Review phase

- Security testing techniques and tools
  - General testing approaches
  - Design review
    - Assessment of security requirements
    - Identifying security-critical aspects - hotspots
  - Source code review
    - Code review for software security
    - Taint analysis
    - Heuristic-based
    - Static code analysis
      - Static code analysis
      - Exercise – Static code analysis using FlawFinder
  - Testing the implementation
    - Manual vs. automated security testing
    - Penetration testing
    - Stress tests
    - Binary and memory analysis
      - Exercise - Binary analysis with strings
    - Instrumentation libraries and frameworks
      - Exercise - Using Valgrind
    - Fuzzing
      - Automated security testing - fuzzing
      - Challenges of fuzzing
      - Exercise – Fuzzing with AFL (American Fuzzy Lop)
  - Deployment environment
- Assessing the environment
- Password audit
- Exercise – using John the Ripper
- Testing random number generators
- Exercise – Testing random number generators
- Configuration management
  - Configuration management
- Hardening
  - Hardening
  - Network-level hardening
  - Hardening the deployment – server administration
  - Hardening the deployment – access control
- Patch and vulnerability management
  - Patch management
  - Vulnerability repositories
  - Vulnerability attributes
  - Common Vulnerability Scoring System – CVSS
  - Vulnerability management software
  - Case study - Shellshock
    - Shellshock – basics of using functions in bash
    - Shellshock – vulnerability in bash
    - Exercise - Shellshock
    - Shellshock fix and counterattacks
    - Exercise – Command override with environment variables
- Principles of security and secure coding
  - Matt Bishop’s principles of robust programming
  - The security principles of Saltzer and Schroeder
- Knowledge sources
  - Secure coding sources – a starter kit
  - Vulnerability databases
  - Recommended books – C/C++

**Wymagania:**

Advanced C/C++ development
Poziom trudności

Certyfikaty:

The participants will obtain certificates signed by SCADEMY (course completion).

Prowadzący:

Authorized SCADEMY Trainer

Informacje dodatkowe:

Training come with a number of easy-to-understand exercises providing live hacking fun. By accomplishing these exercises with the lead of the trainer, participants can analyze vulnerable code snippets and commit attacks against them in order to fully understand the root causes of certain security problems. All exercises are prepared in a plug-and-play manner by using a pre-set desktop virtual machine, which provides a uniform development environment.

SCADEMY together with online application security educational platform AVATAO (more about AVATAO [www.avatao.com](http://www.avatao.com)) for each of participant SCADEMYs authorized training adds the 30 days business AVATAO trial holds the following package:

- 30-day customized free trial
